Welcome to Greene Environmental!

Greene Environmental is a full service, certified mold remediation, testing and consulting company servicing Atlanta since 2005. Our staff has a combined experience of over 30 years.

What is mold?

Mold is a very large group of microscopic fungi that thrive on moist and porous matter such as wet drywall and damp wood. Molds are filamentous and thus have a large surface area to produce spores that can be toxic to humans. Spores are easily spread by air, water, and insects.

Is mold in my home?

Airborne mold spores are everywhere both indoors and outdoors. The risk to a person's health is seriously elevated when levels of mold spores indoors is greater than outdoor levels. Air sampling during a mold inspection will compare indoor mold spore levels to outdoor mold spore levels.

Is the mold in the air a risk to my health?

Molds spores can cause serious health problems even when the spores are not viable (not alive) or dormant (inactive while waiting for more moisture to resume growth). Inhaling, ingesting or touching both non-viable and dormant molds can make a mold-sensitive person ill.

What levels of mold spores can make me sick?

Levels that determine safe and unsafe amounts of mold indoors have not yet been established. Greene Environmental has no absolute levels for safe or unsafe mold levels inside a home or building. Because everyone's immune system is different, what might be a harmless amount of mold exposure to one occupant can be devastating health-wise to another person.
